
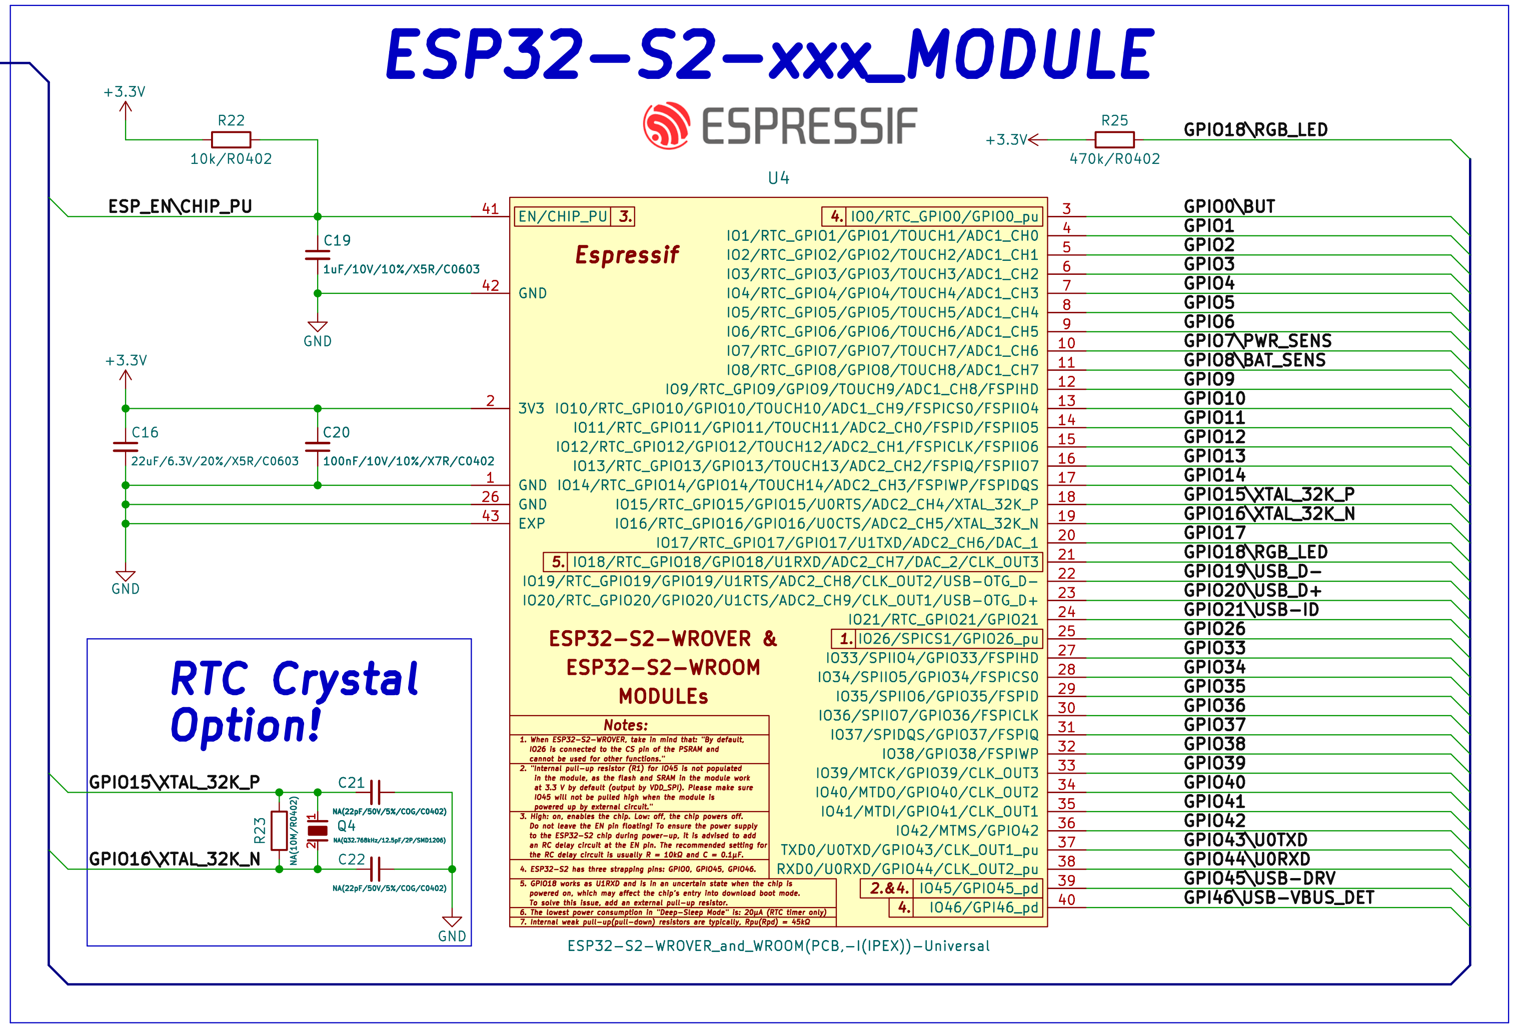
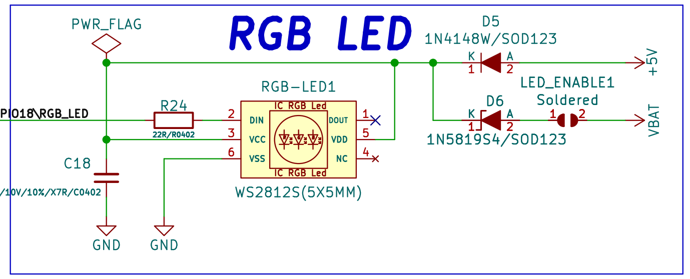
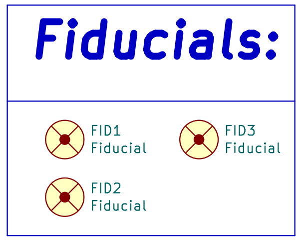
Auto program

DTR	RTS->EN	IO0	
1	1	1	1
0	0	1	1
1	0	0	1
0	1	1	0







UART_PRINT _CONTROL	GPIO46	ROM Code Printing Control
0	–	ROM code will always print information to UART during boot. GPIO46 is not used.
1	0	Print is enabled during boot
	1	Print is disabled
2	0	Print is disabled
	1	Print is enabled during boot
3	–	Print is always disabled during boot. GPIO46 is not used.

ESP32-S2 has three strapping pins: GPIO0, GPIO45, GPIO46

Bootstrapping Pins Settings

Voltage of Internal LDO (VDD_SPI Voltage) [See: Note 1]			
Pin [See: Note 2]	Default	3.3V	1.8V
IO45\GPIO45	Pull-Down	0	1
Booting Mode			
Pin	Default	SPI Flash Boot	Download Boot
IO0\GPIO0	Pull-Up	1	0
IO46\GPIO46	Pull-Down	Don't-care	0
Enabling/Disabling ROM Code Print During Booting [See: Note 3,4]			
Pin	Default	Enabled	Disabled
IO46\GPIO46	Pull-Down	See the fourth note	See the fourth note

Notes:

1. Firmware can configure register bits to change the settings of "VDD_SPI Voltage".
2. Internal pull-up resistor (R1) for IO45 is not populated in the module, as the flash and SRAM in the module work at 3.3V by default (output by VDD_SPI). Please make sure IO45 will not be pulled high when the module is powered up by external circuit.
3. ROM code can be printed over TXD0 (by default) or DAC_1 (IO17), depending on the eFuse bit.
4. When eFuse UART_PRINT_CONTROL value is:
   0, print is normal during boot and not controlled by IO46.
   1 and IO46 is 0, print is normal during boot; but if IO46 is 1, print is disabled.
   2 and IO46 is 0, print is disabled; but if IO46 is 1, print is normal.
   3, print is disabled and not controlled by IO46.
