Version 2.2, 11/19/2010
by Brian Schmalz of Schmalz Haus

www.schmalzhaus.com/EBB

Changes List

v1.2 12/03/2009
Switched to A4983 drivers
Added four RC servo connectors
Ganged some logic I/O between drivers
Switched pot and power conn to SW1
All extra I/O now on left side

v1.3 01/18/2010
All STEP/DIR now on PortD
CB moved away from power connector
Moved pins and RSJ for human fingers
Auto power from USB and gpper jack
Removed fused resistor in VREG circuit
Fixed bug with R4/R1
Added pull ups on enable for bootloading
CPU can monitor input voltage now

v1.4 03/03/2010
Removed solenoid circuit
Pushed motor connectors together
Moved servo connectors to top edge
Added step/dir/enable nets to connectors
Added 10V optional motor headers

v1.5 04/12/2010
Added RC servo power input
Added 5V regulator for RC servo power
06/09/2010
SF: Changed D1 to bigger diode
06/09/2010
SF: Changed C14 to higher voltage (larger footprint)

08/05/2010
SF: Moved some silk screen to avoid vias and connectors
v2.0 5/25/2010
SF: Added test point, some headers now locking

Changed footprint for D1 to bigger diode
Fixed minor silk screen errors from v1.5
v2.1 10/27/2010
Moved R16 to avoid screw head
J1/J2 now have larger holes (more headers now fit)

Merged Sparkfun's changes from v1.5 to now into this file
v2.2 11/19/2010
Changed value on R17 from 47K to 68K
This is necessary to trigger the IO threshold of 3V
The IO RC17 on the pic is a Schmidt trigger input and needs 0.8 * Vdd,
which is 2.65V as a minimum HIGH threshold

Updates on v23: (1/5/12 Theo)

-replaced two driver IC footprints with 1:1 rev
-routed all traces directly away from those ICs
-moved some vias as necessary
