The diagram shows a differential amplifier circuit. Two MBT3904DW1T1 transistors are used. The base of the first transistor is connected to a 10K resistor (Q2A) and the base of the second transistor is connected to a 10K resistor (Q2B). The emitters of both transistors are connected to a common emitter resistor R17. The collector of the first transistor is connected to a 10K resistor (Q2A) and the collector of the second transistor is connected to a 10K resistor (Q2B). The output is labeled DTR. The circuit is powered by a 0V supply.
